Title : Skin Cancer and Its Early Diagnosis.

Orig Pub : Vracheb. dolo, 1956, No 8, 797-802

Abstract : Seven-hundred-and-sixty-nine cases (355 men and 414 women) of skin cancer (SC) were analyzed. The majority of the patients was older than 40 years of age. In 81 percent of the cases cancer was localized in the areas of the bridge of the nose, the inner corners of the eye, the suborbital cavity, the nasolabial fold, and the skin of the upper lip. In 13.3 percent of the cases primary SC was found in the area of the forehead, on the superciliary arches, on the cheeks, the auricles, the lids, and the hairy part of the head. In only 1.4 percent of the

TITLE: Heat and gas metabolism in acute radiation sickness 19

SOURCE: K voprosam ranney diagnostiki ostroy luchevoy bolezni; sbornik nauchnykh rabot. Kiev, Medgiz USSR, 1962, 84-94

TOPIC TAGS: acute radiation sickness, heat exchange, basal metabolism, blood gas composition, blood plasma lakali reserve, tissue temperature

ABSTRACT: Temperature of various organs and metabolism were studied in adult rabbits and dogs. Rabbits were X-irradiated by a RUM-3 unit, 16 r/min and then by a RUM-11 unit, 17.5 r/min in doses of 400, 650, and 900 r. Dogs were X-irradiated simultaneously by a RUM-3 unit, 11.6 r/min in doses of 400 and 200 r. Temperature of the skin, hip muscles, mucous membrane of the upper respiratory passages, and rectum were measured with a Bioterm unit. For the dogs, gas exchange, basal metabolism, blood gas composition, blood plasma alkali reserve, and oxygenation were used as indices in addition to temperature measurements and hematological data. It was found that in the first 3 hrs after irradiation a mean temperature increase of 1.0° is

Card 1/3

L 17559-63

ACCESSION NR: AT3002366

observed for hip muscles and rectum, and a mean temperature increase of 1.5-2.0° is observed for skin areas and mucous membrane of the upper respiratory passages. At the same time the basal metabolism rate increases (with increased oxygen intake and increased heat exchange). After 24 hrs the temperature of the hip muscles and rectum either remains at the same level or increases a little, but the temperature of the skin and mucous membrane of the upper respiratory passages starts to decrease. Basal metabolism rate remains the same or increases a little. At the height of radiation sickness the basal metabolism rate is at its highest and temperature also increases (particularly for hip muscles and rectum). During the convalescent period both basal metabolism rate and temperature are restored to their normal levels between the 40th and 50th days. The author divides the nature of the changes during acute radiation sickness into two periods. During the early period the compensation mechanisms of the organism are mobilized and all indices studied increase. In the second period the compensatory functions of the organism are impaired and basal metabolism and temperature indices decrease and blood disturbances are observed. The further development of acute radiation sickness is determined to some extent by the structural changes in the organs and tissues, but mostly by the pathological discoordination of the various

TITLE: Determination of losses in a ruby laser with a detuned resonator

SOURCE: Zhurnal prikladnoy spektroskopii, v. 4, no. 3, 1966, 236-239

TOPIC TAGS: ruby laser, laser resonator, resonator loss, resonator mirror, mirror alignment

ABSTRACT: Losses in a detuned resonator were determined experimentally by studying the threshold excitation energy as a function of the mirror alignment angle in resonators of various lengths. Measurements were carried out on a ruby laser consisting of a rod 65 mm long and 12 mm in diameter. One of the resonator mirrors was coated with a multilayer dielectric whose coefficient of reflection was 1. The other mirror was 92% reflective and could be rotated around the vertical axis by any angle from 0 to 2°. The mirror angle accuracy was checked by a collimator within 3 sec of arc. In order to reduce the effect of Fresnel scattering, the second ruby end was coated. It was established that the minimum distance between mirrors at which nonaxial (undesirable) modes were not observed was 35 cm. Losses induced by resonator

detuning were determined experimentally from a comparison of the threshold excitation energy for various values of useful losses (using mirrors with different reflection coefficients) and for various mirror alignments. The pumping conditions and the resonator base were not varied. The results are indicated in Fig. 1. The generated power (curve 2), calculated and adjusted for losses by means of the probability method formula derived by B. I. Stepanov and V. P. Gribkovskiy (UFN, 62, 201, 1964) compares favorably with the experimental data (curve 3), although it is at variance with theoretical data calculated by Stepanov and A. P. Prishvalko (ZhPS, 1, 333, 1964) for gas and neodymium glass lasers. Orig. art. has: 4 figures. [YK]

TITLE: Demixing in the systems: phenol - pyridine - isooctane and
phenol - aniline - isooctane
PERIODICAL: Referativnyy zhurnal. Khimiya, no. 19, 1961, 47, abstract
19B362 (Uch. zap. Permsk. un-t, v. 13, no. 3, 1959, 51-56)

TEXT: The solubility of liquid phases in the ternary systems
phenol (I) - pyridine (II) - isooctane (III) and phenol - aniline - III
was studied. The lines of the ternary critical points in the system
I - II - III, unlike the system I - II - water, which has a comparable
character (Mertslin, R. V., Zh. org. khimii, v. 7, 1936, 1828), exhibit
no maxima, which is ascribed to the varying solubility of the compound
 $C_6H_5OH \cdot C_5H_5N$ in water and III. In the system I - aniline - III there is a
demixing range above the critical points of the demixing border systems.

TITLE: Solubility in ternary aqueous salt systems containing cerium nitrate and a nitrate of alkali metal

SOURCE: Zhurnal neorganicheskoy khimii, v. 8, no. 8, 1963, 1955-1963

TOPIC TAGS: cerium nitrate, alkali metal, Na, K, Rb, sodium, potassium, rubidium

ABSTRACT: Authors studied the solubilities of the ternary systems $\text{Ce}(\text{NO}_3)_3$ - NaNO_3 - H_2O ; $\text{Ce}(\text{NO}_3)_3$ - KNO_3 - H_2O ; $\text{Ce}(\text{NO}_3)_3$ - RbNO_3 - H_2O ; and $\text{Ce}(\text{NO}_3)_3$ - CsNO_3 - H_2O at temperatures of 10, 20, and 30°C. It was found that the system $\text{Ce}(\text{NO}_3)_3$ - NaNO_3 - H_2O belongs to the system of a simple eutonic type. In the ternary system $\text{Ce}(\text{NO}_3)_3$ - KNO_3 - H_2O , regions in which the existence of double nitrates of the composition $\text{Ce}(\text{NO}_3)_3 \cdot 2\text{KNO}_3 \cdot 2\text{H}_2\text{O}$, $\text{Ce}(\text{NO}_3)_3 \cdot 2\text{RbNO}_3 \cdot 4\text{H}_2\text{O}$ and $\text{Ce}(\text{NO}_3)_3 \cdot 2\text{CsNO}_3 \cdot 4\text{H}_2\text{O}$ are detected can be found in the above indicated temperature interval. The double nitrates of $\text{Ce}(\text{NO}_3)_3 \cdot 2\text{KNO}_3 \cdot 2\text{H}_2\text{O}$ and $\text{Ce}(\text{NO}_3)_3 \cdot 2\text{CsNO}_3 \cdot 4\text{H}_2\text{O}$ dissolve in water incongruently and the double nitrate $\text{Ce}(\text{NO}_3)_3 \cdot 2\text{RbNO}_3 \cdot 4\text{H}_2\text{O}$ dissolves incongruently at a temperature of 10°C and congruently at temperatures of 20 and 30°C. AUTHOR: Sheveleva, A. D.; Bogdanovskaya, R. L.; Zhuravlev, Ye. F.

TITLE: Solubility of cerium (III) chloride in water and in salt solutions.

SOURCE: Zhurnal neorganicheskoy khimii, v. 9, no. 6, 1964, 1435-1440

TOPIC TAGS: cerium chloride, sodium chloride, potassium chloride, cuprous chloride, solubility, phase equilibrium, rare earth metal

ABSTRACT: The study of aqueous solutions which contain Ce(III) chloride reveals the relationship of cerium chloride and various salt components in a broad range of concentrations and temperatures. Such knowledge is important in the development of technology for the separation and purification of rare earth elements. The determination of the solubility of salt components was conducted by the isothermal cross-section method. The measurements were made of the change of the refractive index of the liquid phase at constant temperature as a function of the composition of the resulting complex. The refractive indices were measured with an Abbe refractometer. The data are given for the solubility of CeCl_3 in water at 10, 20, 30, 40 and 50 C. The solubilities in $\text{CeCl}_3\text{-NaCl-H}_2\text{O}$ and $\text{CeCl}_3\text{-KCl-H}_2\text{O}$ systems were

Card 1/2

ACCESSION NR: AP4039266

studied at 30 and 50 C and in $\text{CeCl}_2\text{-CuCl}_2\text{-H}_2\text{O}$ system at 20 and 50 C. Under these conditions these salts do not form solid solutions or binary salts. In all cases the solid phase consisted of $\text{CeCl}_3\cdot 7\text{H}_2\text{O}$ and $\text{CuCl}_2\cdot 2\text{H}_2\text{O}$. Orig. art. has: 5 figures and 4 tables.
